

# Project 1

## Team members:

Faris Abu 3ram & Amir Altakroori

## Tools:

- ✓ GitHub
- ✓ GitHub Desktop
- ✓ Source tree
- ✓ Trello
- ✓ Visual Studio
- ✓ Code blocks
- ✓ WhatsApp

## Programing languages used:

C++

## Project: Sticky Note

## Summary:

First of all we picked the easiest project to focus on team management not on implementing code itself. We divided the project to small part, then we used trello tools to manage code life, assign tasks, computing time required and so, after this level we concluded that we had enough time to add new features so we added password and background color features to our project. We created a new repository on GitHub and we divided it to more than one branch, firstly we coded some project parts in sub branches. After reviewing it from the second coder and putting comments on code and fixed them, we merged the sub branch to the master branch, and we repeated that step until we finished coding. Finally we reviewed the code and tested it on several tests case then we merge it to master branch for the last time and we published it.
